

Demo Biological Nitrogen Fixation Check

Farm: Nông trại Phú Điền

Plot: Lô A1 - Đậu nành / Lúa Hè

Season: 2026 - Vụ Lúa Hè

Season ID: 19

Plot ID: 1

Record type: Nutrient Input Event

Input source: BIOLOGICAL_FIXATION

Check date: 2026-05-01

Evidence reference: LAB-FDN-BIOFIX-260501

Measured: TRUE

Data source: lab_measured

Source type: LAB_MEASURED

Nitrogen amount: 0.0000 kg N

Crop context: Rice crop after soybean rotation.

Agronomic interpretation:

This record confirms that the current rice crop does not directly fix atmospheric nitrogen. The biological fixation value for the current season is therefore measured

as 0.0000 kg N. The nitrogen benefit in this Happy Path scenario comes from the soil legacy created by the previous soybean season, not from direct fixation by rice.

Note:

Happy path: lúa không tự cố định đạm, giá trị đo thực tế bằng 0.
